Lecture-9 (Dynamic Scheduling)
CS422-Spring 2020

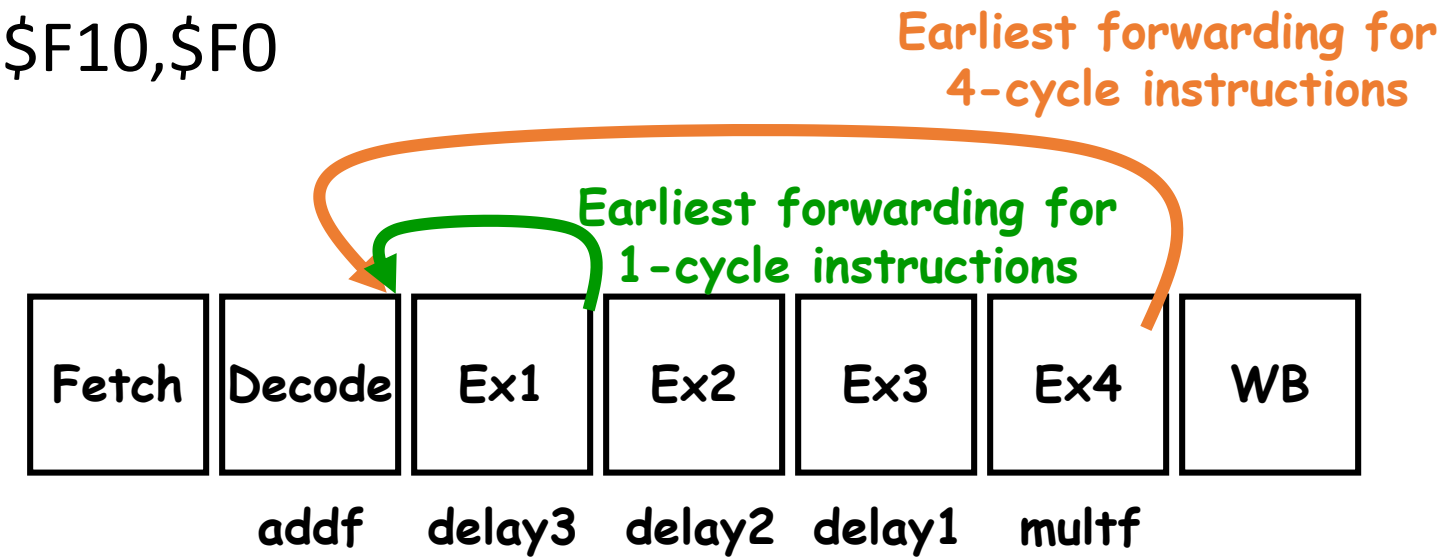
How to Make CPI closer to One

- Let's assume full pipelining:
  - If we have a 4-cycle *latency*, then we need 3 instructions between a producing instruction and its use:

```
multf  $F0,$F2,$F4
delay-1
delay-2
delay-3
addf   $F6,$F10,$F0
```



Out-of-order + Dynamic Scheduling ?

- Pipelining: Tries to achieve CPI =1

- Compiler scheduling minimizes the impacts of dependences.

- Hardware scheduling so far: In order execution
  Instructions after stall must wait even if independent.

Dynamic scheduling: Out of order execution
Hardware lookahead of blocked instructions

- Inorder, O3
- Inorder issue, O3 execute, Inorder completion

Scoreboard

- Out-of-order execution divides ID stage:
  1. Issue - decode instructions, check for structural hazards
  2. Read operands - wait until no data hazards, then read operands (RAW)

  And then
  2. Execute - Execute instruction and notify scoreboard when done
  3. Write - Wait until earlier instructions read operands before writing to register file (WAR)

- Scoreboards date to CDC6600 in 1963

- Instructions execute whenever not dependent on previous instructions and no hazards.

Four Stages of Scoreboard Control - Details

- Issue—decode instructions & check for structural hazards (ID1)
  - Instructions issued in program order (for hazard checking)
  - Don't issue if structural hazard
  - Don't issue if instruction is output dependent on any previously issued but uncompleted instruction (no WAW hazards)

- Read operands—wait until no data hazards, then read operands (ID2)
  - All real dependencies (RAW hazards) resolved in this stage, since we wait for instructions to write back data.
  - No forwarding of data in this model!

Four Stages of Scoreboard Control

- Execution—operate on operands (EX)
  - The functional unit begins execution upon receiving operands. When the result is ready, it notifies the scoreboard that it has completed execution.

- Write result—finish execution (WB)
  - Stall until no WAR hazards with previous instructions:

Example:

```
DIVD   F0,F2,F4
ADDD   F10,F0,F8
SUBD   F8,F8,F14
```

CDC 6600 scoreboard would stall SUBD until ADDD reads operands

Three Parts of the Scoreboard

- Instruction status:
  Which of 4 steps the instruction is in

- Functional unit status:—Indicates the state of the functional unit (FU). 9 fields for each functional unit

  Busy: Indicates whether the unit is busy or not
  Op: Operation to perform in the unit (e.g., + or –)
  Fi: Destination register
  Fj,Fk: Source-register numbers
  Qj,Qk: Functional units producing source registers Fj, Fk
  Rj,Rk: Flags indicating when Fj, Fk are ready

- Register result status—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions will write that register

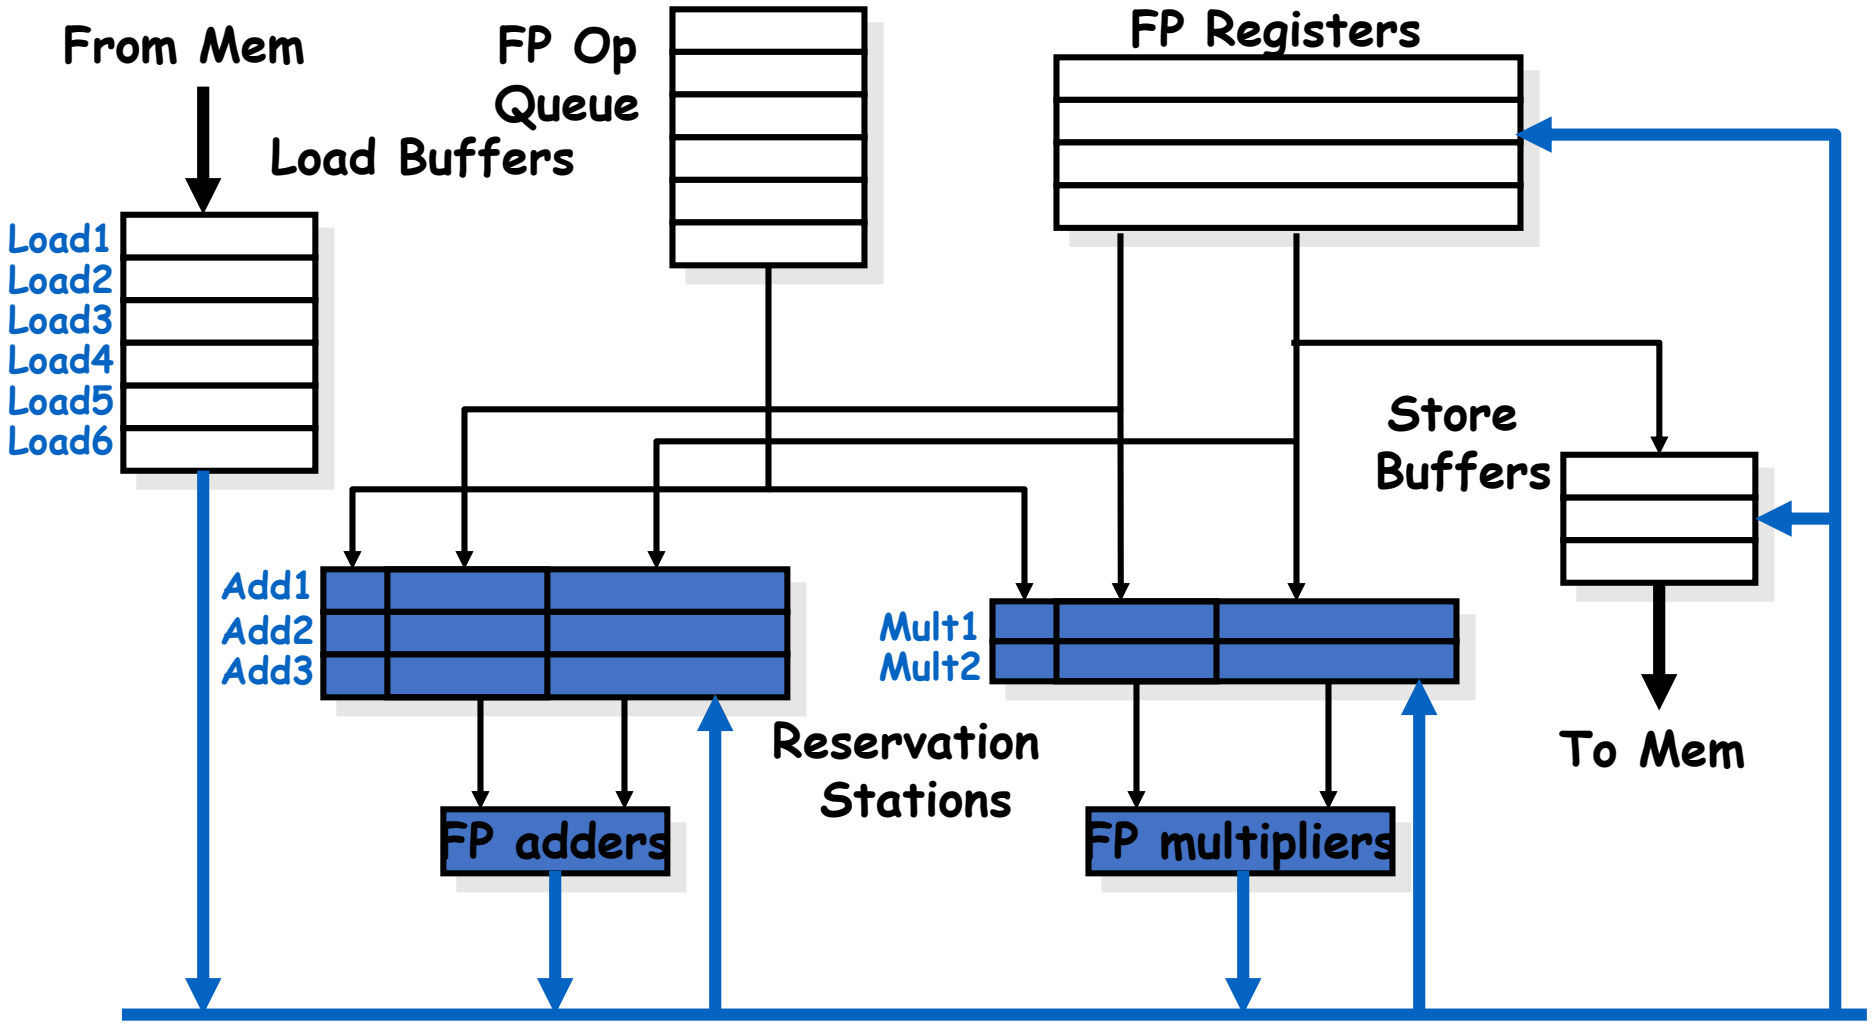
Another Dynamic One: Tomasulo's Algorithm

- For IBM 360/91 about 3 years after CDC 6600 (1966)
- Goal: High Performance without special compilers
- Differences between IBM 360 & CDC 6600 ISA
  - IBM has only 2 register specifiers/instruction vs. 3 in CDC 6600
  - IBM has 4 FP registers vs. 8 in CDC 6600
  - IBM has memory-register ops
- Why Study? lead to Alpha 21264, HP 8000, MIPS 10000, Pentium II, PowerPC 604, …

Tomasulo's Organization



Tomasulo vs Scoreboard

- Control & buffers distributed with Function Units (FU) vs. centralized in scoreboard;
  - FU buffers called "reservation stations"; have pending operands

- Registers in instructions replaced by values or pointers to reservation stations(RS); called register renaming ;
  - avoids WAR, WAW hazards
  - More reservation stations than registers, so can do optimizations compilers can't

- Results to FU from RS, not through registers, over Common Data Bus that broadcasts results to all FUs
- Load and Stores treated as FUs with RSs as wells

Reservation Station Components

Op: Operation to perform in the unit (e.g., + or –)

Vj, Vk: Value of Source operands

– Store buffers has V field, result to be stored

Qj, Qk: Reservation stations producing source registers (value to be written)

– Note: No ready flags as in Scoreboard; Qj,Qk=0 => ready

– Store buffers only have Qi for RS producing result

Busy: Indicates reservation station or FU is busy

Register result status—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions that will write that register.

Three Stages of Tomasulo Algorithm

1. Issue—get instruction from FP Op Queue

   If reservation station free (no structural hazard),
   control issues instr & sends operands (renames registers).

2. Execution—operate on operands (EX)

   When both operands ready then execute;
   if not ready, watch Common Data Bus for result

3. Write result—finish execution (WB)

   Write on Common Data Bus to all awaiting units;
   mark reservation station available

- Normal data bus: data + destination ("go to" bus)
- Common data bus: data + source ("come from" bus)
  - 64 bits of data + 4 bits of Functional Unit source address
  - Write if matches expected Functional Unit (produces result)
  - Does the broadcast

Tomasulo vs Scoreboard

Pipelined Functional Units	Multiple Functional Units
(6 load, 3 store, 3 +, 2 x/÷)	(1 load/store, 1 + , 2 x, 1 ÷)
window size: ≤ 14 instructions	≤ 5 instructions
No issue on structural hazard	same
WAR: renaming avoids	stall completion
WAW: renaming avoids	stall issue
Broadcast results from FU	Write/read registers
Control: reservation stations	central scoreboard
